

Hi Keith,

Last time I saw you, I was pregnant and editing manuscripts for an Asian company. Deven is already fourteen months old, walking, and asking, "Dat?" at everything he sees. Now I am working with Science Editors Network (SEN), a group of PhD scientists (a few from UCSF) who specialize in science communication.

SEN has been helping biomedical faculty write grants, publish papers, and build their web presence for over 10 years. We have extensive experience with a large array of grants (NIH, NSF, HHMI, CIRM, etc.) — resulting in over \$60 million in funding to our clients to date — as well as with manuscript writing for a variety of journals (Nature, Cell, JACS, PLOS Biology, etc.). We have facilitated scientific writing and editing projects for faculty at all levels of experience, including young faculty in the early stages of their career. We can work one-on-one with individual faculty or partner with academic departments/universities to design creative programs to support their faculty.

We recently helped design and implement two very exciting projects at Stanford University and the University of Connecticut to promote faculty success and retention. As part of a two-year grant to the Stanford University School of Medicine, we provided writing/editing and website development services to faculty in basic science and clinical departments; we also managed the other career flexibility services offered through this grant.

We would love to introduce similar programs at UCSF. Would you be interested in talking to me about how SEN could work with UCSF?

I hope all is well with you and the lab!

Best,  
Karin

Karin Engel, PhD  
SEN Editor
